Experiment 2.2 – PartA

=

```
import java.util.*;
```

```
class Employee {
```

```
String name;
```

```
    int age;
```

```
double salary;
```

```
    Employee(String name, int  
age, double salary) {
```

```
        this.name = name; this.age  
= age; this.salary = salary;
```

```
    }
```

```
@Override
```

```
    public String toString() {  
return name + " | Age: " + age +  
" | Salary: " + salary;  
  
    }  
}
```

```
// Main class must be named  
Main in Programiz public  
class Main {  
  
    public static void main(String[]  
args) {  
  
        List<Employee> employees  
= Arrays.asList(  
  
            new Employee("John",  
28, 50000),  
  
            new Employee("Alice",  
24, 60000),  
  
            new Employee("Bob", 30,  
45000)  
  
        );
```

```
System.out.println("\nSorted by  
Name:");  
  
    employees.stream()  
        .sorted((e1, e2) ->
```

```
e1.name.compareTo(e2.name))  
.forEach(System.out::println);
```

```
System.out.println("\nSorted by  
Age:");    employees.stream()  
            .sorted((e1, e2) ->  
Integer.compare(e1.age,  
e2.age))
```

```
.forEach(System.out::println);
```

```
System.out.println("\nSorted by  
Salary (Descending):");  
employees.stream()  
            .sorted((e1, e2) ->  
Double.compare(e2.salary,  
e1.salary))
```

```
.forEach(System.out::println);
```

```
}
```

```
}
```

Output

```
Sorted by Name:
Alice | Age: 24 | Salary: 60000.0
Bob | Age: 30 | Salary: 45000.0
John | Age: 28 | Salary: 50000.0

Sorted by Age:
Alice | Age: 24 | Salary: 60000.0
John | Age: 28 | Salary: 50000.0
Bob | Age: 30 | Salary: 45000.0

Sorted by Salary (Descending):
Alice | Age: 24 | Salary: 60000.0
John | Age: 28 | Salary: 50000.0
Bob | Age: 30 | Salary: 45000.0

=== Code Execution Successful ===
```

PART B –

```
import java.util.*;
```

```
class Student {
```

```
String name;
```

```
double marks;
```

```
    Student(String name, double
marks) {
```

```
        this.name = name;
```

```
this.marks = marks;
```

```
}
```

```
@Override
```

```
public String toString() {
```

```
        return name + " | Marks: "
+ marks;
    }
}
```

// Must be Main in Programiz

```
public class Main {
    public static void main(String[]
args) {
        List<Student> students =
Arrays.asList(        new
Student("Ravi", 85),
            new Student("Sneha",
72),        new Student("Amit",
90),        new Student("Priya",
65)
        );
    }
}
```

```
System.out.println("Students
with marks > 75 sorted by
marks:");
students.stream()
    .filter(s -> s.marks > 75)
    .sorted((s1, s2) ->
```

```
Double.compare(s1.marks,  
s2.marks))  
        .map(s -> s.name)  
  
    .forEach(System.out::println);  
    }  
}
```

Output

```
Students with marks > 75 sorted by marks:  
Ravi  
Amit  
  
=== Code Execution Successful ===
```

PART C –

```
import java.util.*; import  
java.util.stream.*; import  
java.util.Comparator;
```

```
class Product {  
    String name;  
    double price;  
    String category;
```

```

    Product(String name, double price, String category) {
this.name = name; this.price = price; this.category = category;
    }

```

```

    @Override    public
String toString() {
        return name + " | " + category + " | $" + price;
    }
}

```

// Must be Main for Programiz

```

public class Main {
    public static void main(String[] args) {
List<Product> products = Arrays.asList(        new
Product("Laptop", 75000, "Electronics"),        new
Product("Phone", 50000, "Electronics"),        new
Product("Shirt", 1500, "Clothing"),        new
Product("Jeans", 2500, "Clothing"),        new
Product("Fridge", 30000, "Electronics")
    );

    // Group by category
    System.out.println("Products grouped by category:");
    Map<String, List<Product>> grouped = products.stream()
.collect(Collectors.groupingBy(p -> p.category));        grouped.forEach((cat, list)

```

```

-> System.out.println(cat + " -> " + list));    // Most expensive product in
each category

    System.out.println("\nMost expensive product in each category:");
    Map<String, Optional<Product>> expensive = products.stream()
        .collect(Collectors.groupingBy(
p -> p.category,
            Collectors.maxBy(Comparator.comparingDouble(p -> p.price))
        ));
    expensive.forEach((cat, prod) -> System.out.println(cat + " -> " + prod.get()));

    // Average price of all products
    double avgPrice = products.stream()
        .collect(Collectors.averagingDouble(p -> p.price));
    System.out.println("\nAverage Price of All Products: " + avgPrice);
}
}

```

Output

Clear

```

Products grouped by category:
Clothing -> [Shirt | Clothing | $1500.0, Jeans | Clothing | $2500.0]
Electronics -> [Laptop | Electronics | $75000.0, Phone | Electronics | $50000.0, Fridge |
    Electronics | $30000.0]

Most expensive product in each category:
Clothing -> Jeans | Clothing | $2500.0
Electronics -> Laptop | Electronics | $75000.0

Average Price of All Products: 31800.0
